## Calculus I Worksheet 4 - Rational Functions Paul L. Bailey

January 31, 2008

A rational function is a function of the form

$$f(x) = \frac{g(x)}{h(x)},$$

where g(x) and h(x) are polynomials.

A rational function is in *lowest form* if the numerator and the denominator have no common complex zeros. Assume that f(x) = g(x)/h(x) is a rational function in lowest form.

The degree of f(x) is  $\max\{\deg(g), \deg(h)\}.$ 

The zeros of f(x) are the zeros of g(x); that is, they are the solutions to g(x) = 0.

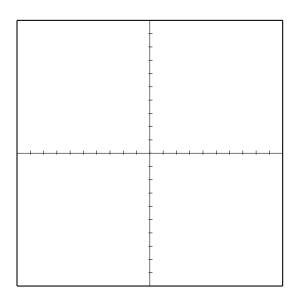

The poles of f(x) the zeros of h(x); that is, they are the solutions to h(x) = 0.

The y-intercept of f(x) is the point (0, f(0)).

The x-intercepts of f(x) are the points (z,0), where z is a real zero of f(x).

The vertical asymptotes of f(x) are the lines x = p, where p is a real pole of f(x).

The polynomial asymptote of f(x) is the polynomial equation y = q(x), where q(x) is the quotient when q(x) is divided by h(x) using polynomial division.

Equation:

$$y = \frac{6}{x - 2}$$
