**Definition 1.** Let  $a \in \mathbb{R}$ .

A *neighborhood* of  $a$  is a set which contains an open interval which contains  $a$ .

A *deleted neighborhood* of  $a$  is a set of the form  $U \setminus \{a\}$ , where  $U$  is a neighborhood of  $a$ .

**Definition 2.** Let  $f$  be defined in a deleted neighborhood of  $a \in \mathbb{R}$ . Let  $L \in \mathbb{R}$ .

We say that the *limit* of  $f(x)$  as  $x$  approaches  $a$  equals  $L$ , and write  $\lim_{x \rightarrow a} f(x) = L$ , if for every neighborhood  $V$  of  $L$  there exists a deleted neighborhood  $U$  of  $a$  such that  $f$  maps  $U$  into  $V$ , that is,

$$x \in U \quad \Rightarrow \quad f(x) \in V.$$

**Definition 3.** Let  $f$  be defined in a neighborhood of  $a \in \mathbb{R}$ .

We say that  $f$  is *continuous* at  $a$  if

- (a)  $f(a)$  exists;
- (b)  $\lim_{x \rightarrow a} f(x)$  exists;
- (c)  $\lim_{x \rightarrow a} f(x) = f(a)$ .

**Definition 4.** Let  $f$  be defined in a neighborhood of  $a \in \mathbb{R}$ .

We say that  $f$  is *differentiable* at  $a$  if

$$\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$$

exists. If this limit exists, it is called the *derivative* of  $f$  at  $a$ , and is denoted  $f'(a)$ .

**Definition 5.** Let  $f$  be defined in a neighborhood  $D$  of  $a \in \mathbb{R}$ .

We say that  $f$  has a *local maximum* at  $a$  if there exists a deleted neighborhood  $U \subset D$  of  $a$  such that

$$x \in U \quad \Rightarrow \quad f(x) < f(a).$$

In this case, we call  $f(a)$  the *local maximum value*.

We say that  $f$  has a *local minimum* at  $a$  if there exists a deleted neighborhood  $U \subset D$  of  $a$  such that

$$x \in U \quad \Rightarrow \quad f(x) > f(a).$$

In this case, we call  $f(a)$  the *local minimum value*.

We say that  $f$  has a *local extremum* at  $a$  if  $f$  has either a local minimum or a local maximum at  $a$ .

**Definition 6.** Let  $f$  be defined on an interval  $I$ .

We say that  $f$  is *increasing* on  $I$  if, for every  $x_1, x_2 \in I$ , with  $x_1 < x_2$ , we have  $f(x_1) < f(x_2)$ .

We say that  $f$  is *decreasing* on  $I$  if, for every  $x_1, x_2 \in I$  with  $x_1 < x_2$ , we have  $f(x_1) > f(x_2)$ .

**Definition 7.** Let  $f$  be differentiable in a deleted neighborhood of  $c \in \mathbb{R}$ .

We say that  $c$  is a *critical point* of  $f$  if either  $f'(c) = 0$ , or if  $f'(c)$  does not exist.

**Definition 8.** Let  $f$  be defined on an interval  $I$ .

We say that  $f$  is *concave up* on  $I$  if for every  $x_1, x_2 \in I$  with  $x_1 < x_2$ , the chord between  $(x_1, f(x_1))$  and  $(x_2, f(x_2))$  lies above the graph of  $f$ .

We say that  $f$  is *concave down* on  $I$  if for every  $x_1, x_2 \in I$  with  $x_1 < x_2$ , the chord between  $(x_1, f(x_1))$  and  $(x_2, f(x_2))$  lies below the graph of  $f$ .

**Definition 9.** Let  $f$  be defined in a neighborhood of  $a \in \mathbb{R}$ .

We say that  $f$  has a *point of inflection* at  $a$  if  $f$  has a tangent line at  $a$ , and the concavity of  $f$  changes at  $a$ .
