Definitions

The *radian measure* of an angle is the arclength of the arc on a circle of radius 1 which subtends the angle when the vertex is placed at the center of the circle. We can convert between degrees and radians by using the fact that

$$360^\circ = 2\pi \text{ radians}.$$

The *wrapping function* $P : \mathbb{R} \to \mathbb{R}^2$ is defined to be the point $P(\theta)$ on the unit circle $x^2 + y^2 = 1$ obtained by moving counterclockwise along the circle an arclength of θ. If $\theta < 0$, this is interpreted as moving clockwise by an arclength of $|\theta|$.

The *sine* and *cosine* functions as defined by

$$\sin\theta = \text{ the } y\text{-coordinate of } P(\theta) \quad \text{and} \quad \cos\theta = \text{ the } x\text{-coordinate of } P(\theta).$$

It is clear that

$$\sin^2\theta + \cos^2\theta = 1.$$

The *tangent*, *cotangent*, *secant*, and *cosecant* are defined by

$$\tan\theta = \frac{\sin\theta}{\cos\theta}, \quad \cot\theta = \frac{\cos\theta}{\sin\theta}, \quad \sec\theta = \frac{1}{\cos\theta}, \quad \csc\theta = \frac{1}{\sin\theta}.$$
