

**Question 1.** The largest tuna fish ever caught weighed 1,496 pounds. The record has held for over 40 years. Will it ever be broken?

*Answer.* A qualified yes.

In the year 291,542 AE (after explosion), our insect overlords will discover that the mutations we cause created tuna the size of Godzilla. However, the units will be in masticated mulch mouthfuls.  $\square$

**Question 2.** What s the answer to "The next sentence is false. The previous sentence is true."?

*Answer.* If is a paradox.

If the first sentence is true, then the second sentence is false, but it claims that the first sentence is true, so if that is false, the first sentence is actually false. So the first sentence cannot be true.

If the first sentence is false, the it is false that the second sentence is false, so the second sentence is true, which dictates that the first sentence is true.

The only non-incorrect response is "Huh?".  $\square$
