Algebra II Dr. Paul L. Bailey Worksheet 2 - Quadratic Functions Monday, October 18, 2021 Name:

A *quadratic function* is a polynomial of degree two. The *standard form* of a quadratic function is

$$f(x) = ax^2 + bx + c,$$

where a, b, and c are real numbers. The graph is a *parabola* which opens upward if a > 0 and opens downward if a < 0. The y-intercept is the point (0, f(0)), and we see that f(0) = c. The zeros of the function are the values of x such that f(x) = 0. The quadratic formula says that f(x) = 0 if and only if

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

The *discriminant* of the quadratic function is

$$\Delta = b^2 - 4ac;$$

this determines the number of real zeros. There are three cases:

(a) if $b^2 - 4ac > 0$, there are two real zeros;

- (b) if $b^2 4ac = 0$, there is one real zero;
- (c) if $b^2 4ac < 0$, there are no real zeros.

The x-intercepts (if any) are the points (x, 0), where x is a real zero.

The *shifted form* of a quadratic function is

$$f(x) = a(x-h)^2 + k,$$

where a, h, and k are real numbers. The shifted form tells how the graph of f(x) is obtained from the graph of x^2 , as follows:

- (a) shift horizontally by h;
- (b) stretch vertically by |a|;
- (c) reflect across the x-axis if a is negative;
- (d) shift vertically by k.

The point (h, k) where the graph turns around is called the *vertex*. Thus k is the *minimum value* of the function if a > 0, and is the *maximum value* of the function is a < 0.

We can convert from standard form to shifted form by completing the square, which leads to:

$$h = -\frac{b}{2a}$$
 and $k = c - \frac{b^2}{4a}$

We can convert from shifted form to standard form by squaring and simplifying, which leads to:

$$b = -2ah$$
 and $c = ah^2 + k$.

Example:	$f(x) = 4x - 5 + x^2$
Standard Form:	$f(x) = x^2 + 4x - 5$
Shifted Form:	$f(x) = (x+2)^2 - 9$
a: 1 b: 4 c:	-5 h: -2 k: -9
Discriminant:	36
Zeros:	x = -5 and $x = 1$
y-intercept:	(0, -5)
x-intercept(s):	(-5,0) and $(1,0)$
Vertex:	(-2, -9)
